

Decimal Numbers

Look at this code:

```
distance = float(input("Enter kilometres: "))
travel_minutes = float(input("Enter travel minutes (not 0): "))

speed = distance / travel_minutes

print("Kilometres per minute:", speed)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Store `[distance] / 2` in a variable called `[halfway_distance]`. Display `[halfway_distance]` before `[speed]`. Test 9 kilometres and 3 minutes; the halfway distance should be 4.5.

Challenge 2

Add a third decimal input called `rest_minutes`. Display `total_minutes` as travel minutes plus rest minutes. For 12.5 and 2.5, the total must be 15.0.

Challenge 3

Create a floor-area calculator. Ask for decimal length and width, multiply them, and display a labelled area. Test 4.5 by 2: the area should be 9.0.
