

Reading 2D Lists

Look at this code:

```
clubs = [["Art", 12], ["Chess", 18], ["Code", 15]]
row = int(input("Club row 0 to 2: "))

print("Record:", clubs[row])
print("Club:", clubs[row][0])
print("Members:", clubs[row][1])
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Ask for a column from 0 to 1 as well as the row. Display the value in [clubs] at [row] and [column]. Test row 2 and column 0; the program should display "Selected field: Code".

Challenge 2

Traverse every row and display each club name followed by its member count. Do not print the row brackets.

Challenge 3

Create a three-row timetable. Each row stores a subject and room number. Ask for a valid row, then display a sentence containing both selected fields. Also display every subject name using a loop.
