

Updating 2D List Cells

Look at this code:

```
clubs = [["Art", 12], ["Chess", 18], ["Code", 15]]
row = int(input("Club row 0 to 2: "))
new_members = int(input("New member count: "))
clubs[row][1] = new_members
print("Updated record:", clubs[row])
print("All records:", clubs)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the second input so the user adds members instead of replacing the total. Test row 2 and add 2; "Code" should have 17 members and the other records should stay unchanged.

Challenge 2

Let the user choose a valid row and update both its club name and member count. Display the selected row before and after the two assignments.

Challenge 3

Create a three-row stock table containing item name and quantity. Ask for a valid row and a delivery amount, add that amount to the existing quantity, then display the updated record and every item quantity.
