

Counted Loops

Look at this code:

```
number = int(input("Which times table? "))
for count in range(1, 6):

    print(number, "x", count, "=", number * count)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

The display stops too soon. Change `range()` so the starter prints the first ten multiples, then check that the final line is the tenth multiple.

Challenge 2

Let the user choose where the table begins. Use `range()` with that starting multiplier to display five consecutive multiples.

Challenge 3

Create a three-line announcement. Ask for a short message, then use a `for` loop and `range()` to display "1 [message]", "2 [message]" and "3 [message]". Try it with "Ready".
