

Condition Loops

Look at this code:

```
target = 7
attempts = 0
guess = 0
while guess != target and attempts < 3:
    guess = int(input("Guess 1 to 10: "))
    attempts = attempts + 1
print("Finished in", attempts, "tries.")
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the program so the user has two attempts. Test one run by guessing 7 first and another with two wrong guesses. The program should display 1 try and 2 tries.

Challenge 2

Give the player five attempts. Update the finishing message to report the guesses used. Test an early correct guess and five unsuccessful guesses; both counts must be accurate.

Challenge 3

Create a door-code checker with a `while` loop that allows at most three attempts. Stop early when `"open"` is entered, then display either a success message or a final locked message with the attempts used.
