

Choosing Loop Structures

Look at this code:

```
for round_number in range(1, 4):  
    print("Warm-up round", round_number)  
answer = ""  
while answer != "done":  
    answer = input("Type done to finish: ")  
print("Session complete.")
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Make the counted warm-up display rounds 1 to 5. The condition-controlled section must still finish only when the user types done.

Challenge 2

Add an attempt counter to the `while` loop. After done is entered, display the number of answers entered. For wait, wait, done the count must be 3.

Challenge 3

Create a practice timer without real-time code. Use a `for` loop to display exactly four exercise stations, then a `while` loop to collect effort ratings until the user enters 0. Count and display the non-zero ratings.
