

# Text Length and Lines

Look at this code:

```
message = input("Short message: ")
character_count = len(message)

print("Message:\n" + message)

print("Characters:", character_count)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

## Programming Challenges

### Challenge 1

Remove spaces from the start and end of [message] before displaying and counting it. Test "Code now" with two spaces before and after it; the message should display as "Code now" and the count should be 8.

### Challenge 2

Collect a title and a subtitle. Display both on separate lines, then display a labelled character count for each one.

### Challenge 3

Create a two-line poster checker. Ask for a heading and one instruction, display the poster on two lines, and report the combined character count using the two `len()` results.
