

Several Functions

Look at this code:

```
def double(number):  
    return number * 2  
def square(number):  
    return number * number  
print("1: double\n2: square")  
choice = input("Choice: ")  
value = int(input("Number: "))  
if choice == "1":  
    print("Result:", double(value))  
else:  
    print("Result:", square(value))
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change `square()` into `triple()`, update menu route 2, and make choice 2 with value 6 display Result: 18.

Challenge 2

Add a third function called `half(number)` that returns `number / 2`. Add menu route 3 and an invalid-choice message. Test 3 with 5 and x with 5.

Challenge 3

Build a measurement helper with separate functions to show a menu, calculate rectangle area, and calculate rectangle perimeter. The main program collects length and width, selects one calculation, and displays a labelled result; include an invalid route.
