

# Decisions

Look at this code:

```
choice = input("Choose walk or read: ")
if choice == "walk":

    print("Take a walk in the park.")
else:
    print("Read a book at home.")
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

## Programming Challenges

### Challenge 1

Change the first choice from "walk" to "cycle". Update the input message, the `if` comparison and its output so "cycle" displays "Ride a bike in the park." Keep the "read" choice and its output unchanged. Test "cycle"; display "Ride a bike in the park." Test "read"; display "Read a book at home."

### Challenge 2

Start with your Challenge 1 program. Ask for the user's name and store it in `[name]` before asking for "cycle" or "read". Include `[name]` in both outputs. Test "Sam" and "cycle"; display "Sam rides a bike in the park." Test "Sam" and "read"; display "Sam reads a book at home."

### Challenge 3

Ask "Do you want tea?" and store the answer in `[answer]`. Use `if` and `else` so "yes" displays "Tea is ready." and every other answer displays "Choose another drink." Test "yes"; display "Tea is ready." Test "no"; display "Choose another drink."
