

Counted Loops

Look at this code:

```
number = int(input("Which times table? "))
for count in range(1, 6):

    print(number, "x", count, "=", number * count)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change `range()` so `[count]` uses the numbers 1 through 10. For the input 4, the first line must be "4 x 1 = 4" and the last line must be "4 x 10 = 40".

Challenge 2

Ask which table line to start with and store the whole number in `[start]`. Use `range()` to display five lines beginning with `[start]`. For table 3 and start 4, display lines from "3 x 4 = 12" through "3 x 8 = 24".

Challenge 3

Create a three-line announcement. Ask for a short message, then use a `for` loop and `range()` to display "1 [message]", "2 [message]" and "3 [message]". Try it with "Ready".
