

Choosing Loop Structures

Look at this code:

```
for round_number in range(1, 4):  
    print("Warm-up round", round_number)  
answer = ""  
while answer != "done":  
    answer = input("Type done to finish: ")  
print("Session complete.")
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change `range()` in the `for` loop so it displays warm-up rounds 1 through 5. Do not change the `while` loop; it must `continue` asking until the user enters "done".

Challenge 2

Create `[counter]` and store 0 in it before the `while` loop. Add 1 to `[counter]` each time the user enters an answer, including "done". After "done" is entered, display "Answers entered:" followed by `[counter]`. Test "wait", "wait", then "done"; display "Answers entered: 3".

Challenge 3

Use a `for` loop to display "Exercise 1" through "Exercise 4". After those four lines, use a `while` loop to ask for whole-number effort scores until the user enters 0. Store the number of scores entered in `[ratings]`, but do not count 0. Test 2, 3 and 0; display "Scores entered: 2".
