

Text Length and Lines

Look at this code:

```
message = input("Short message: ")
character_count = len(message)

print("Message:\n" + message)

print("Characters:", character_count)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Use `strip()` to remove spaces from the start and end of `[message]` before using `len()`. Store the new length in `[character_count]`. Test " Code now "; display "Code now" on the message line and "Characters: 8" on the final line.

Challenge 2

Ask for a title and store it in `[title]`. Ask for a subtitle and store it in `[subtitle]`. Display the title and subtitle on separate lines, followed by a labelled `len()` result for each one. Test "Code Club" and "Join today"; display "Title characters: 9" and "Subtitle characters: 10".

Challenge 3

Ask for a poster heading and store it in `[heading]`. Ask for one instruction and store it in `[instruction]`. Display `[heading]` on the first line and `[instruction]` on the second line by placing `\n` between them. Add `len(heading)` and `len(instruction)`, then display "Combined characters:" followed by the result. Test "Welcome" and "Sit here"; display "Combined characters: 15".
