

Random Steps and Choices

Look at this code:

```
import random

even_step = random.randrange(2, 13, 2)
colour = random.choice(["red", "blue", "gold"])
print("Move:", even_step)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Use `randrange()` to generate one of these whole numbers: 5, 10, 15, 20, 25 or 30. Store the result in `[move]` and display "Move:" followed by `[move]`. Run the program several times and check that no other number appears.

Challenge 2

Add "green" to `[colours]`. Use `random.choice()` twice and store the results separately in `[first_colour]` and `[second_colour]`. Display each result on a labelled line. For example, if "red" and "green" are selected, display "First colour: red" and "Second colour: green".

Challenge 3

Store three activity `strings`, such as "jumps", "push-ups" and "squats", in `[activities]`. Generate a random even whole number from 2 through 12 and store it in `[count]`. Select one random item from `[activities]` and store it in `[activity]`. Display "Training prompt:" followed by `[count]` and `[activity]`, such as "Training prompt: 8 jumps" or "Training prompt: 4 push-ups".
