

Character Codes

Look at this code:

```
letter = input("One lower-case letter a-y: ")
code = ord(letter)

next_letter = chr(code + 1)
print("Character code:", code)
print("Next letter:", next_letter)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the input message so it asks for one lower-case letter from b to z. Subtract 1 from [code], pass the result to `chr()`, and store the returned character in [previous_letter] instead of [next_letter]. Test "d"; display "Previous letter: c".

Challenge 2

Ask for one lower-case letter between a and w and store it in [letter]. Ask for a whole number between 1 and 3 and store it in [shift]. Add [shift] to the character code, pass the result to `chr()`, and store the returned character in [encoded]. Test "c" and 2; display "Encoded letter: e".

Challenge 3

Ask for three lower-case letters between a and y. Increase each character code by 1 and pass each result to `chr()`. Join the three returned characters and store the result in [encoded_text]. Test "a", "b" and "c"; display "Encoded text: bcd".
