

Deleting by List Position

Look at this code:

```
tasks = ["email", "design", "test", "publish"]
position = int(input("Completed position 0 to 3: "))
completed = tasks[position]
del tasks[position]
print("Completed:", completed)
print("Remaining:", tasks)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Keep the user's deletion. Display the new first task with the label "Next:". Test position 0; "email" should be completed and "design" should be next.

Challenge 2

After the first deletion, ask for a second valid position in the shortened list. Label and delete that item, then display what remains. Test the program by entering 1 for both positions.

Challenge 3

Store "Ari", "Bao", "Cleo" and "Dara" in [queue]. Ask for a cancellation position from 0 to 3 and store it in [position]. Store the selected name in [cancelled], delete it from [queue], and display "Cancelled:" followed by [cancelled]. Use a for loop and a counter called [number] to display the position and name of each remaining person. Test position 1; the remaining lines must be "0 Ari", "1 Cleo" and "2 Dara".
