

Reading 2D Lists

Look at this code:

```
clubs = [["Art", 12], ["Chess", 18], ["Code", 15]]
row = int(input("Club row 0 to 2: "))

print("Record:", clubs[row])
print("Club:", clubs[row][0])
print("Members:", clubs[row][1])
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Ask for a column from 0 to 1 as well as the row. Display the value in [clubs] at [row] and [column]. Test row 2 and column 0; the program should display "Selected field: Code".

Challenge 2

Use a `for` loop to visit each row in [clubs]. For each [club], display "Club:" followed by the value at position 0, then display "Members:" followed by the value at position 1. The starter data must display Art with 12 members, Chess with 18 members and Code with 15 members without displaying list brackets.

Challenge 3

Store ["Maths", 12], ["Music", 4] and ["Science", 8] in [timetable]. Ask for a row from 0 to 2 and store it in [row]. Display "Selected:" followed by the subject, "in room", and the room number from that row. Then use a `for` loop to display every subject name beneath "Subjects:". Test row 1; display "Selected: Music in room 4", followed by Maths, Music and Science on separate lines.
