

Updating 2D List Cells

Look at this code:

```
clubs = [["Art", 12], ["Chess", 18], ["Code", 15]]
row = int(input("Club row 0 to 2: "))
new_members = int(input("New member count: "))
clubs[row][1] = new_members
print("Updated record:", clubs[row])
print("All records:", clubs)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the second input so the user adds members instead of replacing the total. Test row 2 and add 2; "Code" should have 17 members and the other records should stay unchanged.

Challenge 2

Ask for a row from 0 to 2 and store it in [row]. Display "Before:" followed by [clubs][row]. Ask for a new club name and member count and store them in [new_name] and [new_members]. Update both cells in the selected row, then display "After:" followed by the updated row. Test row 1, "Robotics" and 22; display "Before: ['Chess', 18]" and "After: ['Robotics', 22]".

Challenge 3

Store the rows ['Pens', 10], ['Books', 6] and ['Tape', 4] in [stock]. Ask for a row from 0 to 2 and store it in [row]. Ask for a delivery amount and store it in [delivery], then add [delivery] to the quantity at [stock][row][1]. Display the updated row followed by every item name and quantity. Test row 2 and delivery 3; the updated row must be ['Tape', 7].
