

Changing 2D List Rows

Look at this code:

```
clubs = [{"Art", 12}, {"Chess", 18}]
new_club = ["Code", 15]
clubs.append(new_club)
clubs.insert(1, ["Music", 9])
del clubs[0]
for club in clubs:
    print(club[0], club[1])
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Insert ["Drama", 11] at row position 0 and remove the deletion line. The final output must begin Drama 11.

Challenge 2

Ask for a new club name and member count and store them in [name] and [members]. Store both values in [new_club], then append [new_club] to [clubs]. Ask for a deletion position from 0 to 2 and store it in [position], then delete that row. Use a `for` loop to display each remaining club name and member count. Test "Code", 15 and position 0; display "Chess 18" followed by "Code 15".

Challenge 3

Store ['Talk', 1], ['Quiz', 2] and ['Demo', 3] in [schedule]. Ask for an insertion position, event and room, then insert the new [event, room] row at that position. Ask for a different position and delete that row from the enlarged schedule. Use a counter called [number] to display each remaining position, event and room. Test inserting ['Workshop', 4] at position 1 and deleting position 3; display "0 Talk 1", "1 Workshop 4" and "2 Quiz 2".
