

Operators and Integers

Look at this code:

```
num1 = 12
num2 = int(input("Enter a whole number: "))

total = num1 + num2

print("Total:", total)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example so `num1` comes from the user instead of the fixed value 12. Use `int()` to convert the input to a whole number. For example, 8 and 4 display `Total: 12`.

Challenge 2

Extend your Challenge 1 program. Ask how many people will share `total` and store the whole number in `people`. Divide `total` by `people` and display `Each share:` followed by the result. For example, 8, 4 and 3 display `Each share: 4.0`.

Challenge 3

Create a pizza program. Ask how many slices there are, then how many slices each of two friends eats. Convert every answer with `int()` and display `Slices left:` followed by the number left. For example, 12, 3 and 2 display `Slices left: 7`.
