

Counted Loops

Look at this code:

```
number = int(input("Which times table? "))
for count in range(1, 6):

    print(number, "x", count, "=", number * count)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example so it also asks how many lines to show and stores the whole number in `lines`. Use `lines` in `range()` so the table runs from 1 up to `lines`. For example, table 4 with 10 lines ends with "4 x 10 = 40".

Challenge 2

Extend the example so it asks for a starting multiplier and stores it in `start`. Change `range()` so it displays five lines beginning at `start`. For example, table 3 starting at 4 displays "3 x 4 = 12" to "3 x 8 = 24".

Challenge 3

Create a savings planner. Ask for a starting amount and a weekly saving as whole numbers, and store the starting amount in `total`. Use a `for` loop and `range()` to add the saving to `total` each week and display it, such as "Week 1 total: 15". Show weeks 1 to 4.
