

String Positions

Look at this code:

```
word = input("Enter a word: ")
first = word[0]

preview = word[0:3]

print("Initial:", first, "Preview:", preview)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example so it also slices the characters at positions 2 and 3 into `middle`. Display "Middle:" followed by `middle`. For example, "python" displays "Middle: th".

Challenge 2

Change the example so it asks for two words in `first_word` and `second_word`. Use position 0 to display the first character of each word after "Initials:". For example, "Code" and "python" display "Initials: C p".

Challenge 3

Create a reference-code program that asks for a six-letter word. Use two slices to store the first two characters in `first_part` and the last two in `last_part`. Display both after "Reference:". For example, "python" displays "Reference: py on".
