

Changing Text Case

Look at this code:

```
team = input("Team name: ")
team = team.lower()
code = input("Team code: ")
code = code.upper()
print("Team:", team)
print("Code:", code)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example so the code is displayed in uppercase and kept as typed in `typed_code`. Use an `if` statement to display "Code format OK" when `typed_code` equals `code`; otherwise display "Code changed to" followed by `code`. Test "F7", then "f7".

Challenge 2

Change the example so it asks "Accept? yes/no" and stores the answer in `response`. Use `lower()` on `response`, then use `if` and `else` to display "Accepted" for "yes" and "Not accepted" otherwise. For example, "YES" displays "Accepted".

Challenge 3

Create a password checker that asks for a new password twice. Display "Thank you" if the two match exactly. If they only match after using `lower()` on both, display "They must be in the same case". Otherwise display "Incorrect". Test "Code" with "Code", "code" and "cake".
