

Joining Text

Look at this code:

```
first_name = input("First name: ")
last_name = input("Last name: ")

username = first_name.lower() + "." + last_name.lower()

print("Username:", username)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example so the username is the first letter of the first name joined to the whole last name, all in lowercase. Use position 0 to get the first letter. For example, "Asha" and "Khan" display "Username: akhan".

Challenge 2

Change the example so it asks for `last_name` and a department code in `department`. Join the lowercase last name, "-" and the uppercase department, and display the result after "Account label:". For example, "Khan" and "art" display "Account label: khan-ART".

Challenge 3

Create an event-tag program that asks for a venue, an activity and a two-character group code. Join them as venue/activity-GROUP, with the venue and activity in lowercase and the group in uppercase. Display the result after "Event tag:". For example, "Hall", "Quiz" and "b2" display "Event tag: hall/quiz-B2".
