

Text Length and Lines

Look at this code:

```
message = input("Short message: ")
character_count = len(message)

print("Message:\n" + message)

print("Characters:", character_count)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

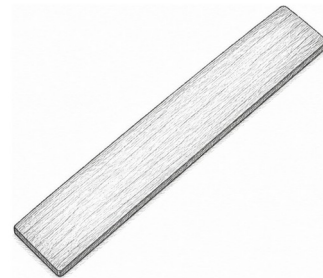

Programming Challenges

Challenge 1

Change the example so it uses `strip()` on `message` before counting its characters with `len()`. For example, "`Code now`" displays "`Code now`" and "`Characters: 8`".

Challenge 2

Change the example so it asks for `title` and `subtitle`. Display them on separate lines after "`Text:`", then use `len()` to display "`Title characters:`" and "`Subtitle characters:`" with each count. For example, "`Code Club`" and "`Join today`" give 9 and 10.

Challenge 3

Create a poster checker that asks for a heading and an instruction. Display them on two lines using "`\n`". Add the two `len()` results and display "`Combined characters:`" with the total. If the total is over 20, also display "`Too long for the poster.`" Test "`Welcome`" and "`Sit here`".
