

Character Codes

Look at this code:

```
letter = input("One lower-case letter a-y: ")
code = ord(letter)

next_letter = chr(code + 1)
print("Character code:", code)
print("Next letter:", next_letter)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example so it asks for a lowercase letter from b to z and finds the letter before it. Subtract 1 from `code`, use `chr()` to store the result in `previous_letter`, and display it after "Previous letter:". For example, "d" displays "Previous letter: c".

Challenge 2

Change the example so it also asks for a whole-number `shift` from 1 to 3. Use `ord()`, add `shift`, then use `chr()` to get the new letter. Display it after "Encoded letter:". For example, "c" and 2 display "Encoded letter: e".

Challenge 3

Create a three-letter encoder. Ask for three lowercase letters from a to y, one at a time. Use `ord()` and `chr()` to move each letter forward by 1, then join the new letters and display them after "Encoded text:". For example, "c", "a" and "t" display "Encoded text: dbu".
