

List Positions and Updates

Look at this code:

```
supplies = ["pencil", "book", "tape"]
position = int(input("Position 0 to 2: "))
print("Old item:", supplies[position])
replacement = input("Replacement item: ")
supplies[position] = replacement
print("Updated list:", supplies)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example so it swaps two items instead of replacing one. Ask for two positions from 0 to 2, store the first item in `temp`, and use it to swap the items. Display the `list` after "Updated list:". For example, 0 and 2 display "Updated list: ['tape', 'book', 'pencil']".

Challenge 2

Extend the example so that, after the replacement, it asks for another position in `check_position`. Display the item there after "Selected item:", then the updated `list`. For example, 1, "folder" and 1 display "Selected item: folder".

Challenge 3

Create a scoreboard `list` called `scores` holding 0, 0 and 0 for three teams. Twice, ask which team scored (0 to 2) and how many points, then add the points to that team's score. Display the `list` after "Scores:". For example, 1 and 3, then 1 and 2, display "Scores: [0, 5, 0]".
