

Deleting by List Position

Look at this code:

```
tasks = ["email", "design", "test", "publish"]
position = int(input("Completed position 0 to 3: "))
completed = tasks[position]
del tasks[position]
print("Completed:", completed)
print("Remaining:", tasks)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example so it shows which task moved up. After the deletion, display the item now at `position` after "Moved up:". Only use positions 0 to 2. For example, 1 displays "Completed: design" and "Moved up: test".

Challenge 2

Extend the example so it deletes a second task. After the first deletion, ask for a position from 0 to 2, store that task, then delete it. Display both tasks after "Completed:". For example, 1 and 1 display "Completed: design test" and "Remaining: ['email', 'publish']".

Challenge 3

Create a `list` called `queue` holding "Ari", "Bao", "Cleo" and "Dara". Serve the first person: store them in `served`, delete position 0 and display "Served:" with the name. Then ask for a position from 0 to 2, delete that name and display the `list` after "Queue:". For example, 1 gives "Queue: ['Bao', 'Dara']".
