

Working Through Lists

Look at this code:

```
survey = ["tea", "water", "juice"]
for drink in survey:

    print("Drink:", drink)

print("Total drinks:", len(survey))
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example so it counts the drinks as the loop runs. Store 0 in `visited` before the `for` loop and add 1 inside it. After the loop, display `"Visited:"` followed by `visited`, then the existing `len()` total. Both lines should show 3.

Challenge 2

Change the example so `survey` holds `"tea"`, `"water"`, `"tea"` and `"juice"`. Ask for a drink, then use the `for` loop and an `if` statement to count how many times it appears. Display the result, such as `"tea appears 2 times"`.

Challenge 3

Create a `list` called `scores` holding 12, 15, 9, 18 and 6. Use a `for` loop to add each score to `total`. Display `"Total:"` followed by `total`, then `"Average:"` followed by `total` divided by `len(scores)`. The output should be `"Total: 60"` and `"Average: 12.0"`.
