

Reading 2D Lists

Look at this code:

```
clubs = [["Art", 12], ["Chess", 18], ["Code", 15]]
row = int(input("Club row 0 to 2: "))

print("Record:", clubs[row])
print("Club:", clubs[row][0])
print("Members:", clubs[row][1])
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example so it also asks for a column: 0 for the club name or 1 for the member count. Display the value at `row` and `column` after "Selected field:" before the other outputs. For example, row 2 and column 0 display "Selected field: Code".

Challenge 2

Change the example so it displays every row instead of asking for one. Use a `for` loop with `club` to display "Club:" with the name and "Members:" with the count on the next line. The first pair should be "Club: Art" and "Members: 12".

Challenge 3

Create a 2D list called `timetable` with rows ["Maths", 12], ["Music", 4] and ["Science", 8]. Ask for a row from 0 to 2 and display the subject and room, such as "Selected: Music in room 4". Then use a `for` loop to display every subject after "Subjects:".
