

Updating 2D List Cells

Look at this code:

```
clubs = [["Art", 12], ["Chess", 18], ["Code", 15]]
row = int(input("Club row 0 to 2: "))
new_members = int(input("New member count: "))
clubs[row][1] = new_members
print("Updated record:", clubs[row])
print("All records:", clubs)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example's second input so it asks how many members to add, stored in `members_to_add`. Add it to the selected row's member count instead of replacing it. For example, row 2 and 2 display "Updated record: ['Code', 17]".

Challenge 2

Change the example so it replaces a whole record. Display the chosen row after "Before:", ask for `new_name` and `new_members`, update both values, then display the row after "After:". For example, row 1, "Robotics" and 22 display "After: ['Robotics', 22]".

Challenge 3

Create a 2D list called `stock` with rows ["Pens", 10], ["Books", 6] and ["Tape", 4]. Ask for a row, a delivery amount and a number sold. Add the delivery and subtract the sales from that row's quantity. Display the updated row, then every item and quantity on separate lines.
