

String Positions

Look at this code:

```
word = input("Enter a word: ")
first = word[0]

preview = word[0:3]

print("Initial:", first, "Preview:", preview)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the slice's stop position so the preview contains four characters instead of three. Try "code" and "python"; both previews should contain four characters.

Challenge 2

Create a two-letter badge from two words. Use indexing to display the first character of each; use inputs with different capitalisation to inspect the result.

Challenge 3

Build a reference code for a six-letter word. Use two slices to display its first two characters, then characters five and six. Try "python": the two parts should be "py" and "on".
