

Deleting by List Position

Look at this code:

```
tasks = ["email", "design", "test", "publish"]
position = int(input("Completed position 0 to 3: "))
completed = tasks[position]
del tasks[position]
print("Completed:", completed)
print("Remaining:", tasks)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Use position 0 as the completed task. The output must label email as completed and show the other three tasks in order.

Challenge 2

After the first deletion, ask for a second valid position in the shortened list, label that item, delete it, and display what remains. Test first 1 then 1.

Challenge 3

Build a queue editor with four names. Ask for one valid cancellation position, store and delete that name, then traverse the remaining queue with numbered positions using a counter.
