

Working Through Lists

Look at this code:

```
survey = ["tea", "water", "juice"]
for drink in survey:

    print("Drink:", drink)

print("Total drinks:", len(survey))
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Make each survey line read "Choice: [drink]" instead of "Drink: [drink]". The loop must still visit every item and the total must stay correct.

Challenge 2

Add a fourth survey answer to the list. Before running, predict the last answer and the total that will appear; then check both.

Challenge 3

Create a colour-survey summary with three answers of your choice. Use a for loop to label every colour, then use len() once to report how many answers were collected.
