

Several Functions

Look at this code:

```
def show_menu():
    print("1: double")
    print("2: square")
def double(number):
    return number * 2
def square(number):
    return number * number
show_menu()
choice = input("Choice: ")
value = int(input("Number: "))
if choice == "1":
    print("Result:", double(value))
else:
    print("Result:", square(value))
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change square() into triple(), update menu route 2, and make choice 2 with value 6 display Result: 18.

Challenge 2

Add a third function called half(number) that returns number / 2. Add menu route 3 and an invalid-choice message. Test 3 with 5 and x with 5.

Challenge 3

Build a measurement helper with separate functions to show a menu, calculate rectangle area, and calculate rectangle perimeter. The main program collects length and width, selects one calculation, and displays a labelled result; include an invalid route.
