

# Decisions

Look at this code:

```
choice = input("Choose walk or read: ")
if choice == "walk":

    print("Take a walk in the park.")
else:
    print("Read a book at home.")
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

## Programming Challenges

### Challenge 1

Change the `if` condition in the example so it checks for `"read"` instead of `"walk"`. Swap the two `print()` lines so each choice still gets the right message. Predict what `"swim"` will display, then test it.

### Challenge 2

Extend the example so it asks for the user's name first and stores it in `name`. Include `name` in both messages. For example, `"Sam"` and `"walk"` display `"Sam takes a walk in the park."`

### Challenge 3

Create a program that asks two friends for their favourite colour and stores the answers in `colour_1` and `colour_2`. Use an `if` statement to compare them. Display `"You match!"` if they are the same; otherwise display `"Different, but both great choices."`
