

Nested Decisions

Look at this code:

```
raining = input("Is it raining? yes/no: ")
if raining == "yes":
    windy = input("Is it windy? yes/no: ")
    if windy == "yes":
        print("Wear a coat.")
    else:
        print("Take an umbrella.")
else:
    print("No rain gear needed.")
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the inner question in the example to ask for "strong", "light" or "none" wind and store the answer in `wind`. Use `if`, `elif` and `else` inside the rain route to display "Wear a coat.", "Take an umbrella." or "A hood will do." Test each answer.

Challenge 2

Extend the example's no-rain route. Ask whether it is sunny and use a nested `if` statement to display "Take sunglasses." for "yes" and "No weather gear needed." otherwise. Test "no" then "yes", and "no" then "no".

Challenge 3

Create a library program that asks whether the visitor has a card. Use a nested `if` statement so only card holders are asked whether a book is overdue. Display "Return the overdue book first.", "You may borrow a book." or "Apply for a library card." Test all three routes.
