

Choosing Loop Structures

Look at this code:

```
for round_number in range(1, 4):  
    print("Warm-up round", round_number)  
answer = ""  
while answer != "done":  
    answer = input("Type done to finish: ")  
print("Session complete.")
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example so it first asks how many warm-up rounds to show and stores the whole number in `rounds`. Use `rounds` in `range()` so the `for` loop shows that many rounds. The `while` loop should still end when the user types "done".

Challenge 2

Extend the example so the `while` loop counts every answer in `counter`, including "done". After the loop, display "Answers entered:" followed by `counter`. For example, "wait", "wait" and "done" display "Answers entered: 3".

Challenge 3

Create a training program. Use a `for` loop to display "Exercise 1" to "Exercise 4". Then use a `while` loop to ask for whole-number effort scores until the user enters 0. Count every score except 0 and display "Scores entered:" with the count.
