

Random Whole Numbers

Look at this code:

```
import random

roll = random.randint(1, 6)

print("Dice roll:", roll)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example into a coin toss. Use `random.randint()` to choose 1 or 2, then use `if` and `else` to display "Heads" for 1 and "Tails" for 2. Run the program several times until you have seen both results.

Challenge 2

Change the example so it rolls two dice. Use `random.randint()` twice and store the rolls in `roll_one` and `roll_two`, display both after "Rolls:", then display their sum after "Total:". Run it several times and check each total.

Challenge 3

Create a guessing program. Ask for a minimum and a maximum whole number, then use `random.randint()` to choose a `target` between them, including both. Ask the user to guess it. Display "Correct" or "The target was" followed by `target`. Test 4 and 4 with a guess of 4.
