

Random Steps and Choices

Look at this code:

```
import random

even_step = random.randrange(2, 13, 2)
colour = random.choice(["red", "blue", "gold"])
print("Move:", even_step)
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example's `random.randrange()` call so it chooses one of 5, 10, 15, 20, 25 or 30. Store the result in `move` and display it after "Move:". Run it several times to check that no other number appears.

Challenge 2

Change the example so a `list` called `colours` holds "red", "blue", "gold" and "green". Use `random.choice()` twice to pick `first_colour` and `second_colour`, and display them after "First colour:" and "Second colour:".

Challenge 3

Create a training program with a `list` called `activities` holding three activity words. Use a `for` loop to display three training prompts. Each prompt uses `random.randrange()` for an even number from 2 to 12 and `random.choice()` for an activity, such as "Training prompt: 8 jumps".
