

Changing 2D List Rows

Look at this code:

```
clubs = [{"Art", 12}, {"Chess", 18}]
new_club = ["Code", 15]
clubs.append(new_club)
clubs.insert(1, ["Music", 9])
del clubs[0]
for club in clubs:
    print(club[0], club[1])
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example so the deleted club is not lost. Before the `del` line, store `clubs[0]` in `removed`. After the deletion, use `append()` to add `removed` to the end and display "Moved to end:" with its name before the loop. The loop should now end with "Art 12".

Challenge 2

Change the example so the user supplies the new club. Ask for `name` and a whole-number `members`, store them as a row in `new_club` and append it. Remove the fixed Music insert. Ask for a row to delete from 0 to 2, then use a `for` loop to display the remaining clubs. For example, "Code", 15 and 0 display "Chess 18" and "Code 15".

Challenge 3

Create a 2D list called `schedule` with rows ["Talk", 1], ["Quiz", 2] and ["Demo", 3]. Ask for a position, an event name and a whole-number room, then insert the new row.

Ask for a position to delete and delete that row. Use a `for` loop to display each event and room.
