

Functions with Results

Look at this code:

```
def add_score(first, second):  
    total = first + second  
  
    return total  
  
print("Score:", add_score(7, 5))
```

Use the code above to help you. After completing each challenge below, run your program to test that it works correctly. Save each completed challenge program in a new file.

Programming Challenges

Challenge 1

Change the example so it calls `add_score()` twice: with 7 and 5, then with 10 and 8. Store the results and display them after "First score:" and "Second score:". Work out the totals before you run it.

Challenge 2

Extend the example with a function called `average_score(first, second)` that will `return` the two values added together and divided by 2. After the score, display "Average:" followed by `average_score(7, 5)`. The output should end with "Average: 6.0".

Challenge 3

Create a function called `area(length, width)` that will `return` `length * width`. Ask for the length and width of two rooms as whole numbers. Call `area()` once for each room and display "Total area:" followed by the two results added together. For example, 4 by 3 and 5 by 2 display "Total area: 22".
